Overview

**Brain Stimulation** extends across the entire field of neuromodulation, including noninvasive and invasive techniques and technologies that alter brain function through the use of electrical, magnetic, radiowave, or focally targeted pharmacologic stimulation. This includes investigations that study the effects of brain stimulation on basic processes, such as gene expression and other aspects of molecular biology, neurochemical regulation, functional brain activity, sensorimotor function, and cognitive and affective processes at the systems level.

**Brain Stimulation** seeks the highest level of research on the biophysics and biopsychophysics of stimulation paradigms as well as the use of these techniques as a probe to outline patterns of neural connectivity. As an equal partner with this basic emphasis, the journal will have strong representation of research on the therapeutic potential and adverse effects of the stimulation technologies. The inclusion of research in therapeutics will represent not only clinical trials, but also conceptual pieces, discussions of ethics as they pertain to this field, services research, etc.

1. Applicability

These terms and conditions shall apply to offers, proposals and communications made by supply or distribution of any third party or its agent ("the Client") relating to the products or services of Elsevier ("the Products and/or Services"), and, along with the related Elsevier order acknowledgement, shall form the entire agreement between the parties (the "TC"). They supersede any previous agreements, understandings and communications."
